## ImageJ imgSplit

## Christian Bowman

## imgSplit

Quick and easy ImageJ macro for dividing images into equal grids.

## Workflow:

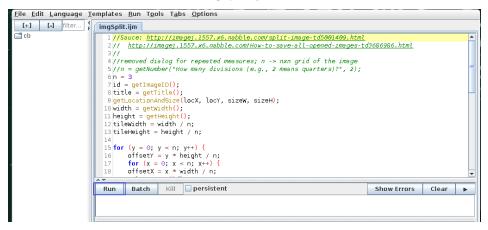

- 1. Download imgSplit.ijm
- 2. Open ImageJ/FIJI
- 3. Navigate to Plugins > Macros > Edit...

4. Open the imgSplit.ijm file (most likely in your /Downloads folder) and a box containing the macro will appear

5. Open the image you would like to split with File > Open...

6. Click "Run" on the box with the imgSplit.ijm file

7. You should see the screen flash a little as the image gets processed. Your original image will close and an output box will appear containing the file name several times.

```
